

Image negative means changing the lighter pixels into dark and via versa and this achieved by subtracting each pixel by 255.

```
2 import cv2
3 im = cv2.imread("p.jpg") #Read it as numpy array
4 negative = 255 - im
5 cv2.imshow('image',negative)
6 cv2.imwrite('negative.png',negative)
7 cv2.waitKey(0)
8 cv2.destroyAllWindows()
```
